

# Tesla Powerwall

The Tesla Powerwall is a battery that can store energy that is collected by solar panels installed in your home.

This is how the Powerwall changes energy from direct current to alternating current, the one that your home uses.

The Tesla Powerwall app helps you keep track of the power, in real time, that is stored within your Powerwall. It also allows you to allocate your power so you can choose how much to store and how much to use for your house.

The Tesla Powerwall is most useful when there are power outages. Since it works as a battery for your home, it can keep your power running even during power outages.
